

Computer Architecture

Lab1:Building Experiment Environment

VirtualBox Introduction

- VirtualBox can run many guest operating systems on a host operating system in X86/AMD64 machine.
- We use it to build a Linux environment for developing our full system simulation platform.

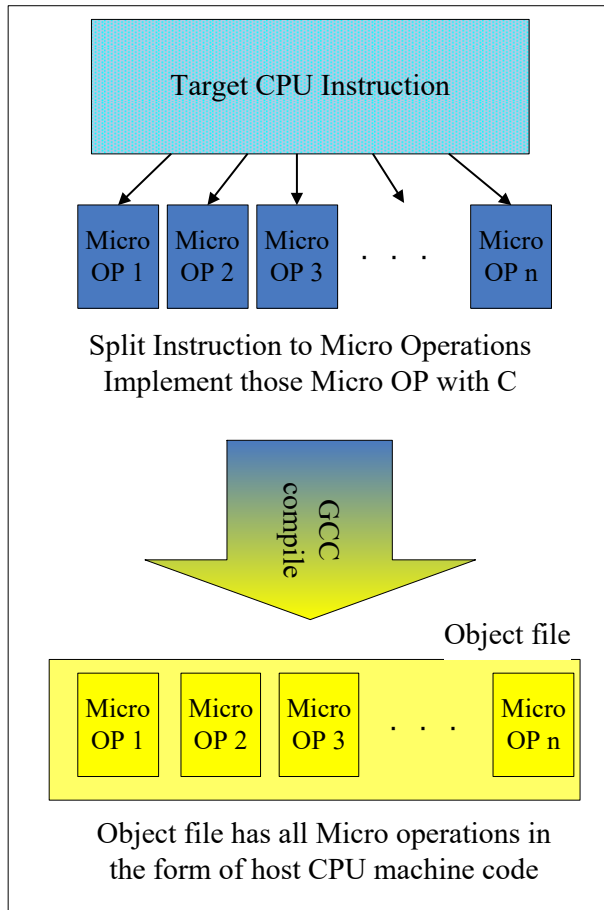

QEMU Introduction

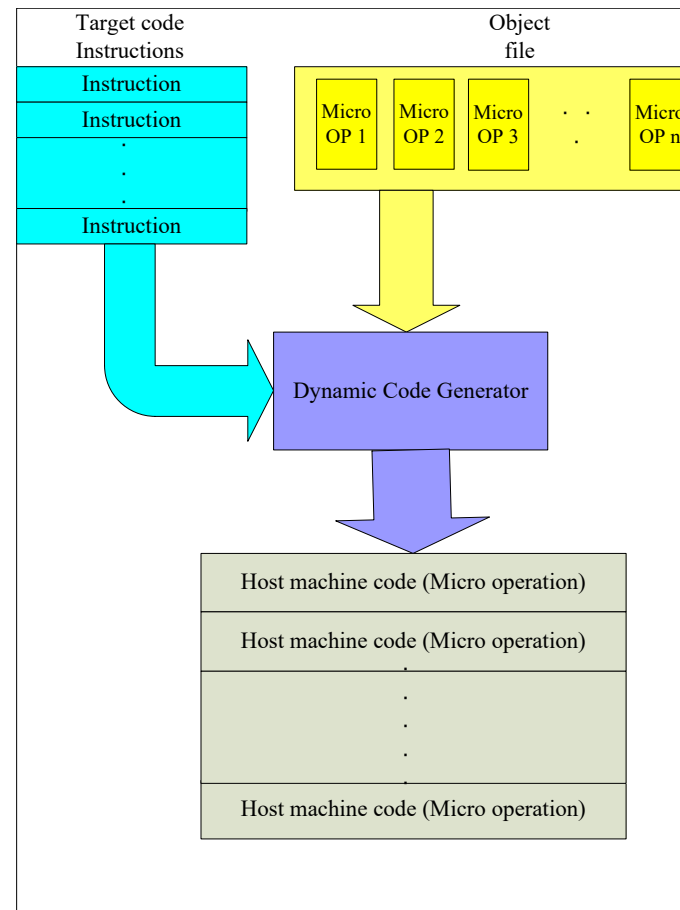

- Unlike Virtualbox is binding with IA32, QEMU can run OSes and programs made for one machine on a different machine.
- QEMU makes this characteristic possible by supporting the portable dynamic translation.

QEMU Introduction (Cont.)

- portable dynamic translation

Compile Time

Run Time

Building Linux Environment

■ Get Virtualbox

- <https://www.virtualbox.org/wiki/Downloads>

■ Get Ubuntu image

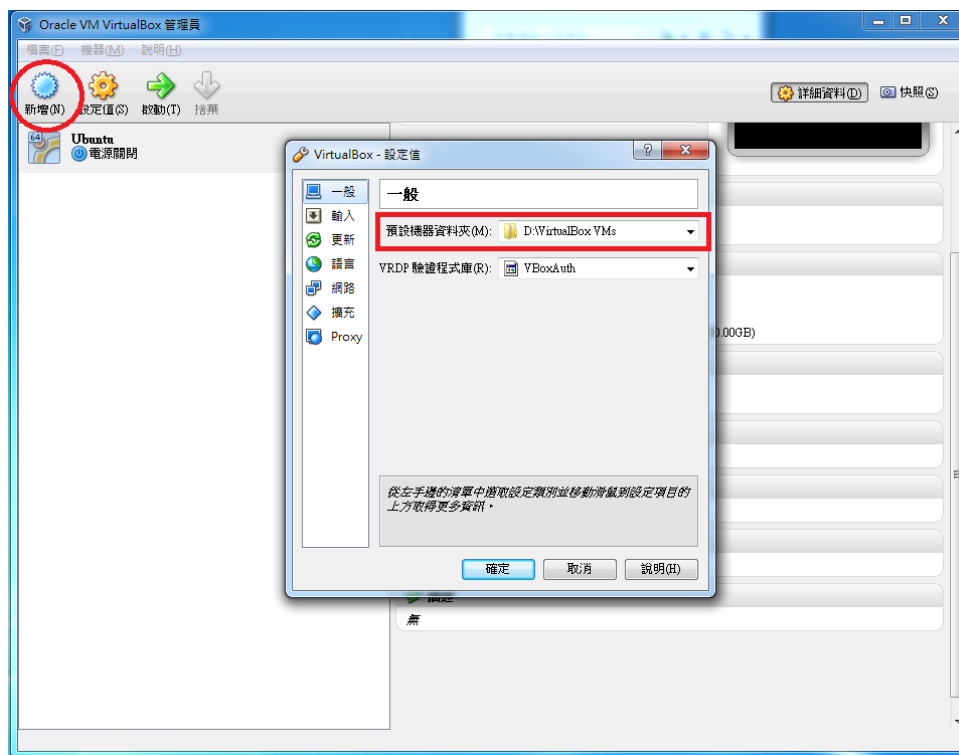

- <https://www.ubuntu.com/download/desktop>

- We use Ubuntu 18.04.1 LTS

- You can chose the proper one or other Linux distribution such as CentOS.

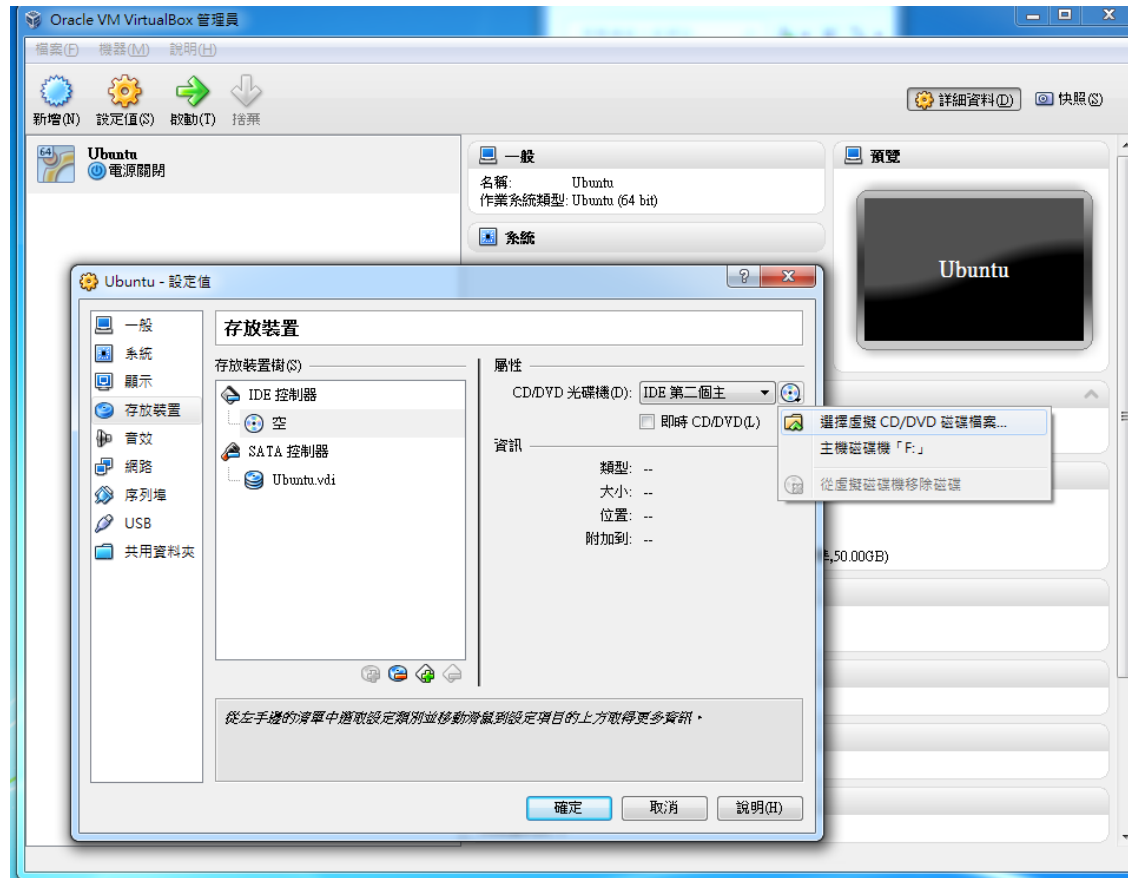

Building Virtual Machine

- Install Virtualbox
- Build the virtual machine
 - 點選新增後按照步驟執行(如果是採用centos，版本可選Red Hat 64)
 - 虛擬機器資料夾可在“檔案->喜好”設定內修改

Setting Virtual Machine

- 點選系統->存放裝置 選擇光碟機圖示
 - 選擇虛擬光碟機並且選取剛剛所下載的Ubuntu映像檔

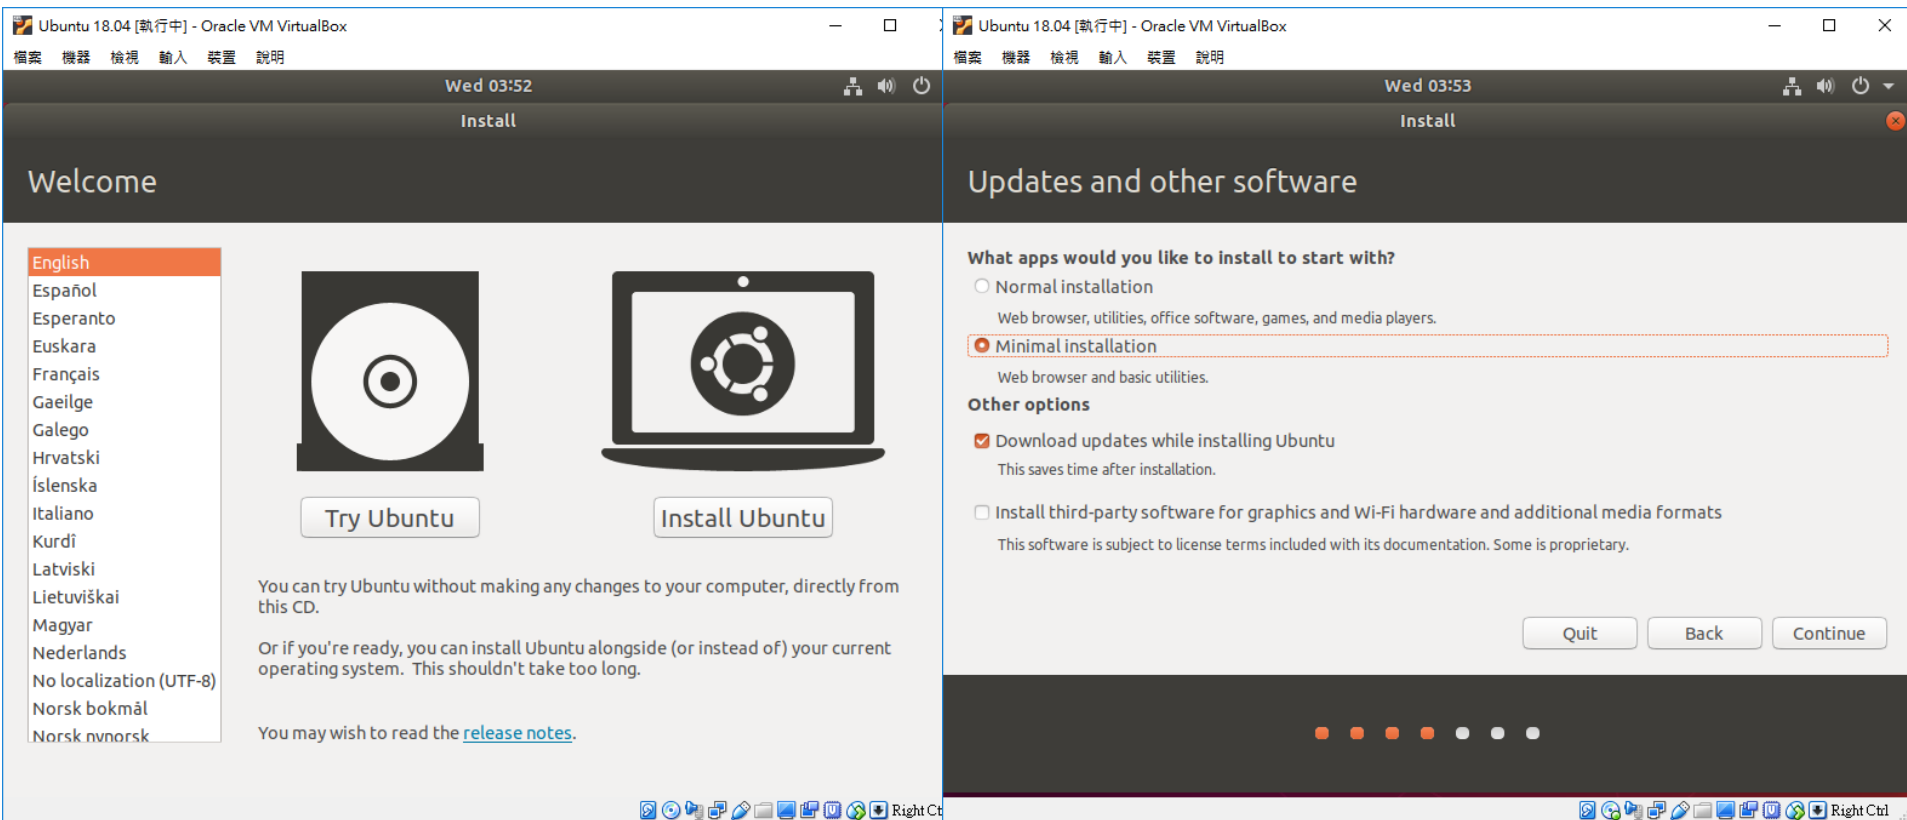

Setting Virtual Machine (Cont.)

- 選擇“共用資料夾”並且選擇掛載之資料夾，勾取自動掛載。之後此虛擬機器一開機即可透過此資料夾與host OS共享資料

Install Ubuntu

- 執行啟動就會自動進入Ubuntu安裝程式

Install Compiler, Library

■ Tools

- GCC
- Make

■ Library

- 32bits support Library (libc6:i386 libncurses5:i386 libstdc++6:i386)
- flex, bison, build-essential

■ Commands:

- `sudo apt-get update`
- `sudo apt-get install gcc g++ make libc6:i386 libncurses5:i386 libstdc++6:i386 flex bison build-essential -y`

Install QEMU

- QEMU source
 - <https://download.qemu.org/qemu-3.0.0.tar.xz>
- 建立工作資料夾，並下載qemu-3.0.0.tar.xz、解壓縮到workspace/Src
 - `mkdir -p ~/workspace/Src`
 - `cd ~/workspace/Src`
 - `wget https://download.qemu.org/qemu-3.0.0.tar.xz`
 - `tar -xvf qemu-3.0.0.tar.xz -C ~/workspace`

Install QEMU(Cont.)

■ 設定QEMU的模擬對象以及所要安裝的目錄

- `cd qemu-3.0.0`
- `mkdir build`
- `cd build`
- `../configure --target-list="arm-softmmu,arm-linux-user" --prefix=${HOME}/workspace/qemu-bin-3.0.0`
- `--target-list`為我們所希望模擬的目標選項。這裡的`arm-softmmu`代表我們想要QEMU針對整個平台(包含CPU與周邊硬體)做模擬(如realview versatile family)，而`arm-linux-user`則是只做CPU指令集架構的轉換模擬。兩者的CPU指令集架構都是透過Binary Transation完成。
- `--prefix`為安裝目的資料夾選項
- `make -j8`
- `make install`

Install QEMU(Cont.)

- 安裝完成後，~/workspace/qemu-bin-3.0.0/bin中有所有的QEMU執行檔
 - qemu-arm 為 arm-linux-user產物
 - qemu-system-arm 為 arm-softmmu 產物
 - 之後的實驗，QEMU的部分我們將透過這兩個執行檔完成。

Cross Compiler

- A cross compiler can build the executable code for the target platform other than the one on which the compiler is run.
- ARM cross compiler
 - ARM-elf-gcc, ARM-linux-gcc
 - RVDS, ADS
 - Build ARM executable code on X86/AMD64 machine

Setting ARM Linux GCC

- Get ARM-Linux-gcc (Mentor)
 - http://www.codesourcery.com/gnu_toolchains/arm/download.html
- 我們以2014.09-25版本(Lite Edition)作範例
 - URL:
<https://sourcery.mentor.com/GNUToolchain/package12813/public/arm-none-linux-gnueabi/arm-2014.05-29-arm-none-linux-gnueabi-i686-pc-linux-gnu.tar.bz2>
 - GCC 4.8.3
 - Glibc 2.18
 - Linux Kernel 4.14.85

Setting ARM Linux GCC (Cont.)

- 解壓縮並且將執行檔宣告至預設執行區(壓縮檔先行放在家目錄)
 - `tar -xvf arm-2014.05-29-arm-none-linux-gnueabi-i686-pc-linux-gnu.tar.bz2 -C ~/workspace`
 - `export PATH="${HOME}/workspace/arm-2014.05/bin:$PATH"`
 - 請注意: `export`此行指令，只要terminal重開就必須再次執行。可用 `vim ~/.bashrc` 加入此行指令讓terminal開啟時自動執行此行指令。
- 執行"`arm-none-linux-gnueabi-gcc -v`"觀察是否設定完成。

Compile C code

- 利用編輯器完成一段簡短的C程式碼並且使用arm-linux-gcc編譯。
 - `cd ~/workspace && mkdir test`
 - 在test資料夾中新增test.c 並寫幾行簡單程式
 - `arm-none-linux-gnueabi-gcc test.c -o test.o`
 - `arm-none-linux-gnueabi-objdump -xD test.o > dump.txt`
 - 從dump.txt可以看出透過cross compiler我們編出ARM code了!

```
test.c x
1 #include <stdio.h>
2
3 int main(){
4
5     printf("COURSE : Computer Architecture\n");
6
7     return 0;
8
9 }
10
```

```
dump.txt x
1
2 test.o:      file format elf32-littlearm
3 test.o
4 architecture: arm, flags 0x00000112:
5 EXEC_P, HAS_SYMS, D_PAGED
6 start address 0x00008380
7
```

Execute ARM code

- 最後透過我們一開始所編譯出的qemu-arm來執行test.o
 - 將所在目錄移至test資料夾
 - `~/workspace/qemu-bin-3.0.0/bin/qemu-arm -L ~/workspace/arm-2014.05/arm-none-linux-gnueabi/libc test.o`
 - 執行檔qemu-arm -L 後面所接的是cross compiler所提供的函示庫 (Library) , 最後的test.o則是我們剛才所編譯出來的檔案。當然您也可以將test.o與qemu-arm搬移出來直接./qemu-arm -L {arm-library位置} test.o
- 執行結果會直接秀在terminal上

```
~/workspace/test$ ~/workspace/qemu-bin-3.0.0/bin/qemu-arm \  
> -L ~/workspace/arm-2014.05/arm-none-linux-gnueabi/libc \  
> test.o
