

處理器設計與實作

實習講義

編撰者

助教：蘇郁翔、黃冠霖、鄭基漢、曾微中、金育涵
暨成大電通所計算機架構與系統研究室CASLAB

國立成功大學電機系與電腦與通信工程研究所

Lab7-實驗大綱與目的

- ⊕ Project Introduction
- ⊕ 實作一 (GPIO experiment)
- ⊕ Appendix1 :溫度感測器模組測試
- ⊕ Appendix2 : ARC API Introduction
 - GPIO API
 - LCD API
 - UART API

Project introduction

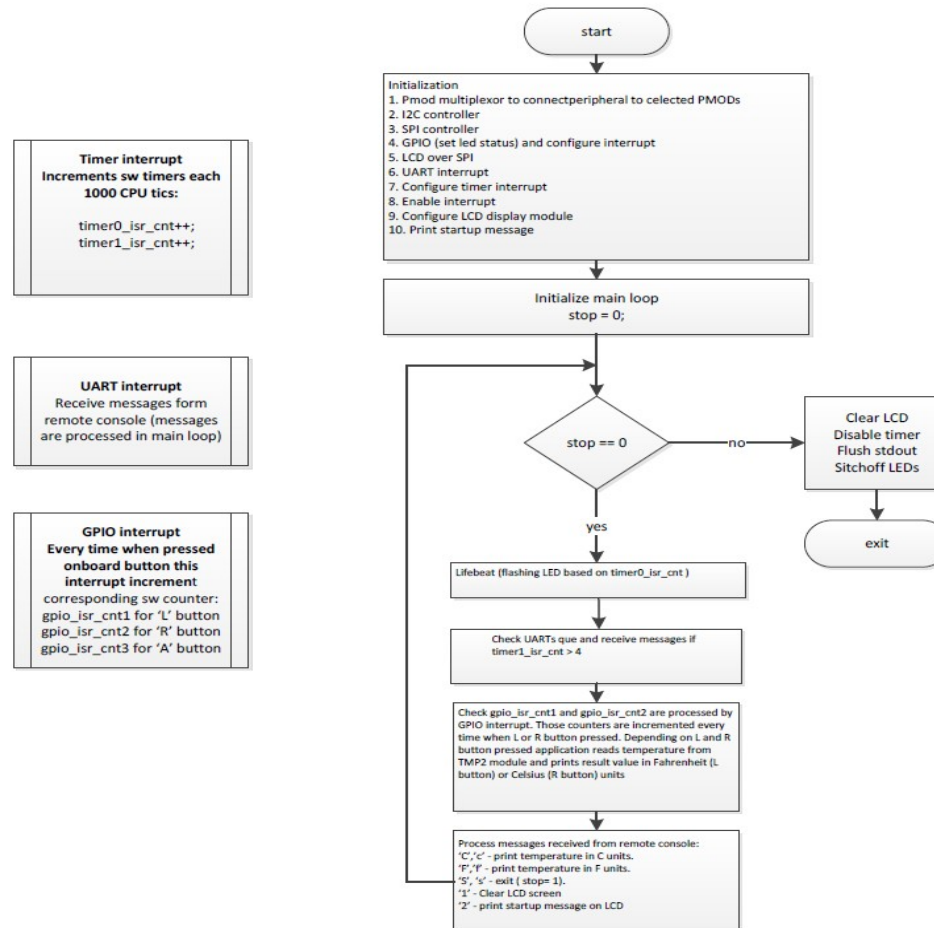

- ⊕ 使用助教提供或是自行購買的模組完成一個期末作品。
- ⊕ 助教可提供LCD、temperature module、open
- ⊕ source code(裡面包含許多API)和教學講義
- ⊕ 需繳交demo 作品以及final project report(期限為最後一次實驗課 1/4)
- ⊕ Report 至少需有題目構想、軟體流程圖、程式碼解析、心得

Ex: Project Report

- ⊕ 題目構想:我們想做一個溫度計，會依照目前的溫度顯示在lcd上，並且依照不同溫度，LED會有不同的閃爍速率.....

Ex: Project Report

⊕ 軟體流程圖:

What is API

API就是皮卡丘 提供 鋼鐵尾巴 跟 雷電 兩種技能給你呼叫 基本上 你不用研究皮卡丘為什麼會發電 也不用研究為什麼尾巴會變鋼鐵 反正你只要說: 上吧皮卡丘 使用雷電!!

What is API

- ⊕ API將許多硬體register設定包在一個function內
- ⊕ 使用者不需知道是如何實現此function，只要知道function功用

```
uart_print(uart, "\n\r*****\n\r");
uart_print(uart, "    ARC EM Starter kit v2.0 *\n\r");
uart_print(uart, "    Flashing LEDs(GPIO) demo *\n\r");
uart_print(uart, "*****\n\r");
```

API

```
// simple debug print
void uart_print(DWCREG_PTR uartRegs, const char * pBuf) {
    unsigned int i = MAX_DEBUG_MSG;

    unsigned char byte = *pBuf++;
    while(byte && i--) {

        // wait if FIFO is full
        while(!(uartRegs[U_USR] & U_USR_TFNF));

        // transmitt data byte
        uartRegs[U_THR] = byte;
        byte = *pBuf++;
    }
}
```

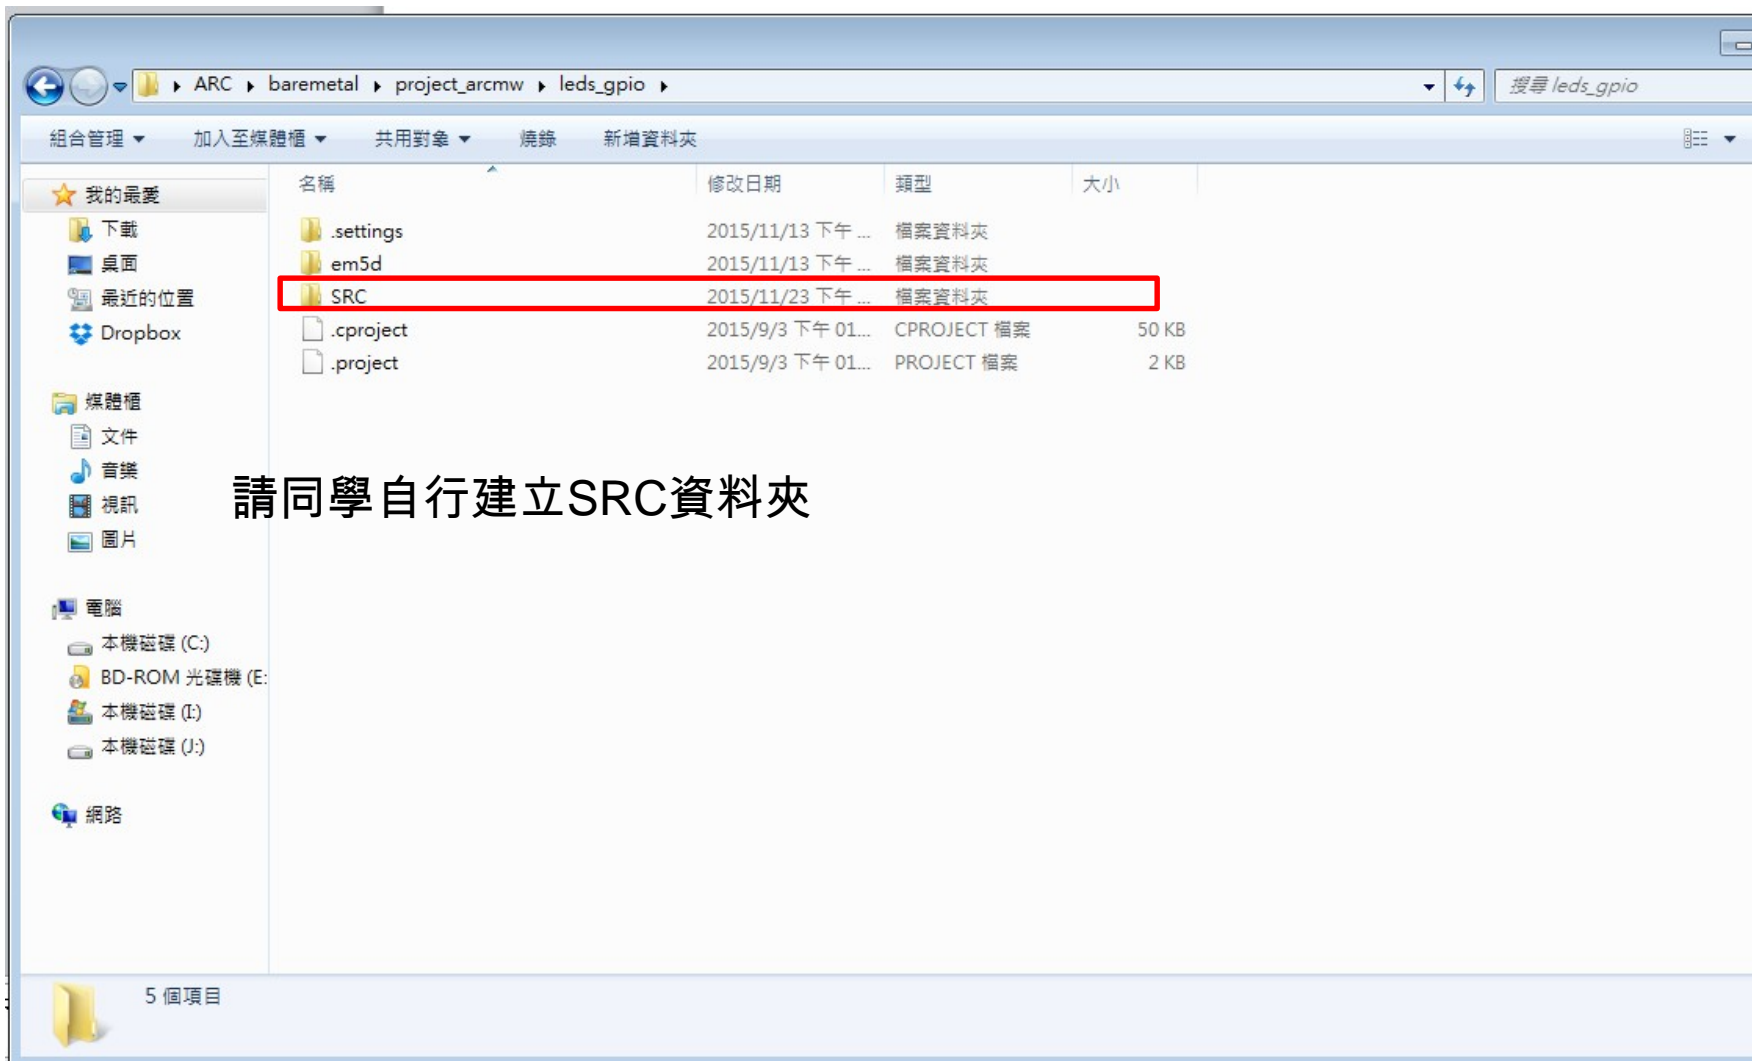

GPIO 介紹

- ⊕ GPIO 是種具有彈性且可以藉由軟體控制 (software-controlled) 的數位訊號
- ⊕ 常見於開發版邊緣, 以針腳 (Pin) 的形式呈現 這些針腳即是開發版與外界溝通的重要橋樑
- ⊕ 簡單例子, 想像成是開關, 使用者可以打開或關閉 (input), 或由開發版來打開或關閉 (output)

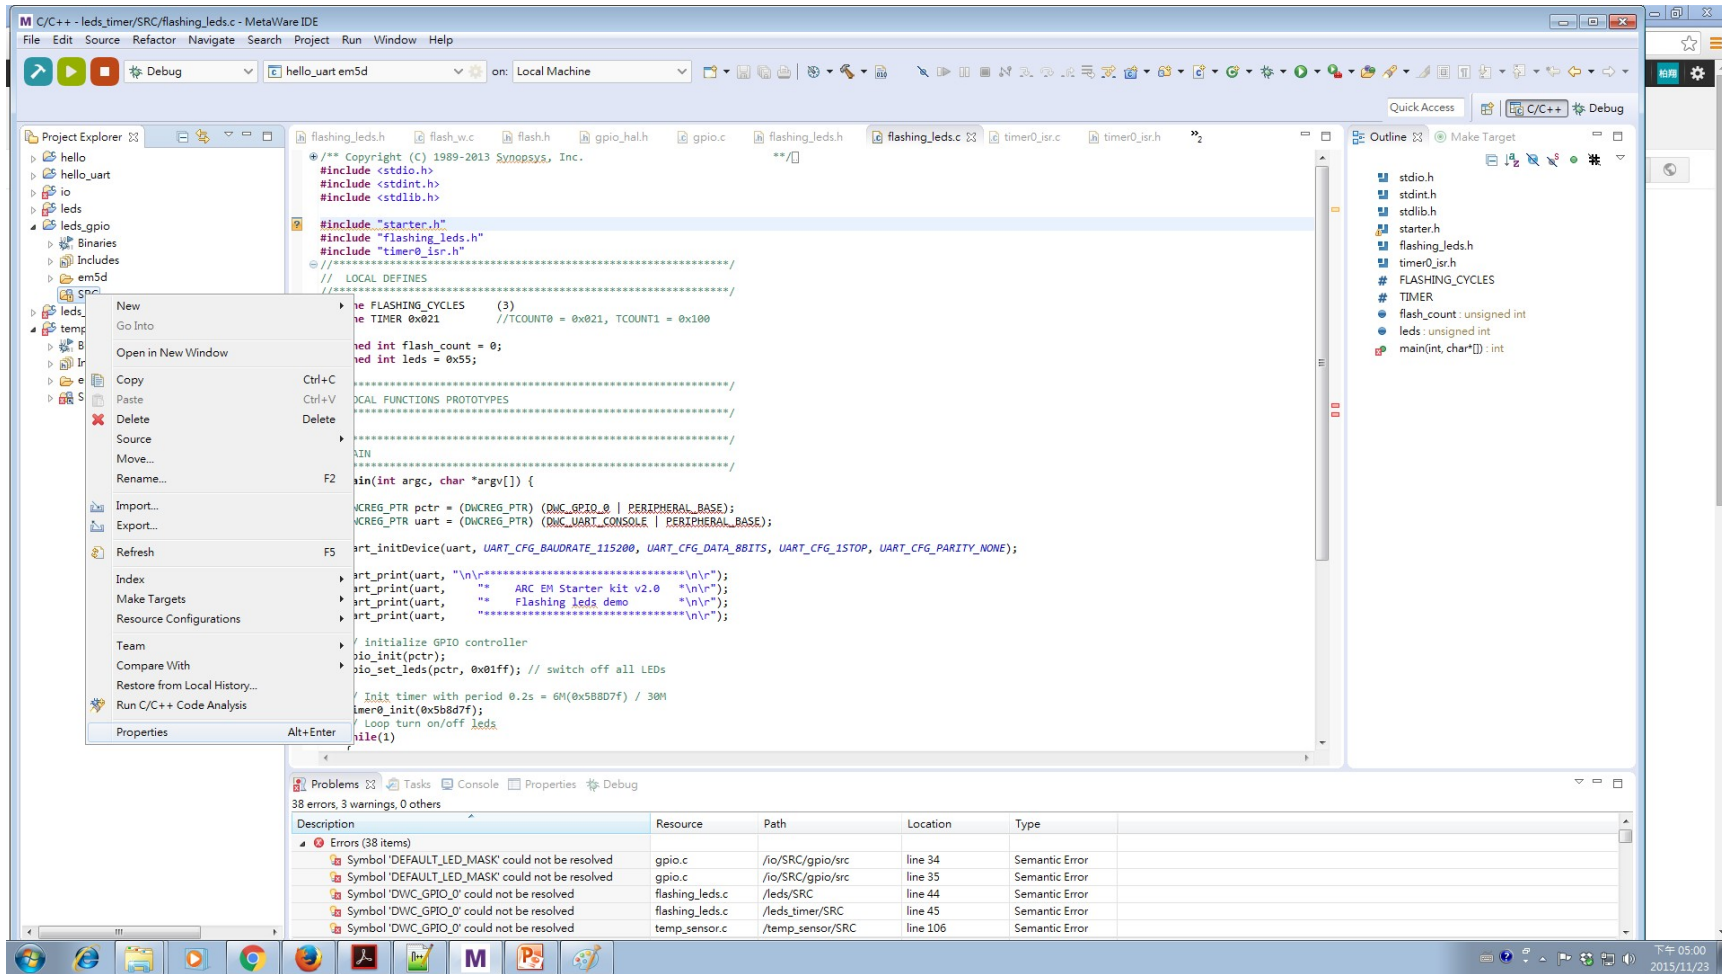

實作過程

- ⊕ 步驟與上個實驗一模一樣 run **leds_gpio** project
- ⊕ 如果src裡面本身沒有gpio_interrupt.c等檔案，可參照下幾頁投影片執行

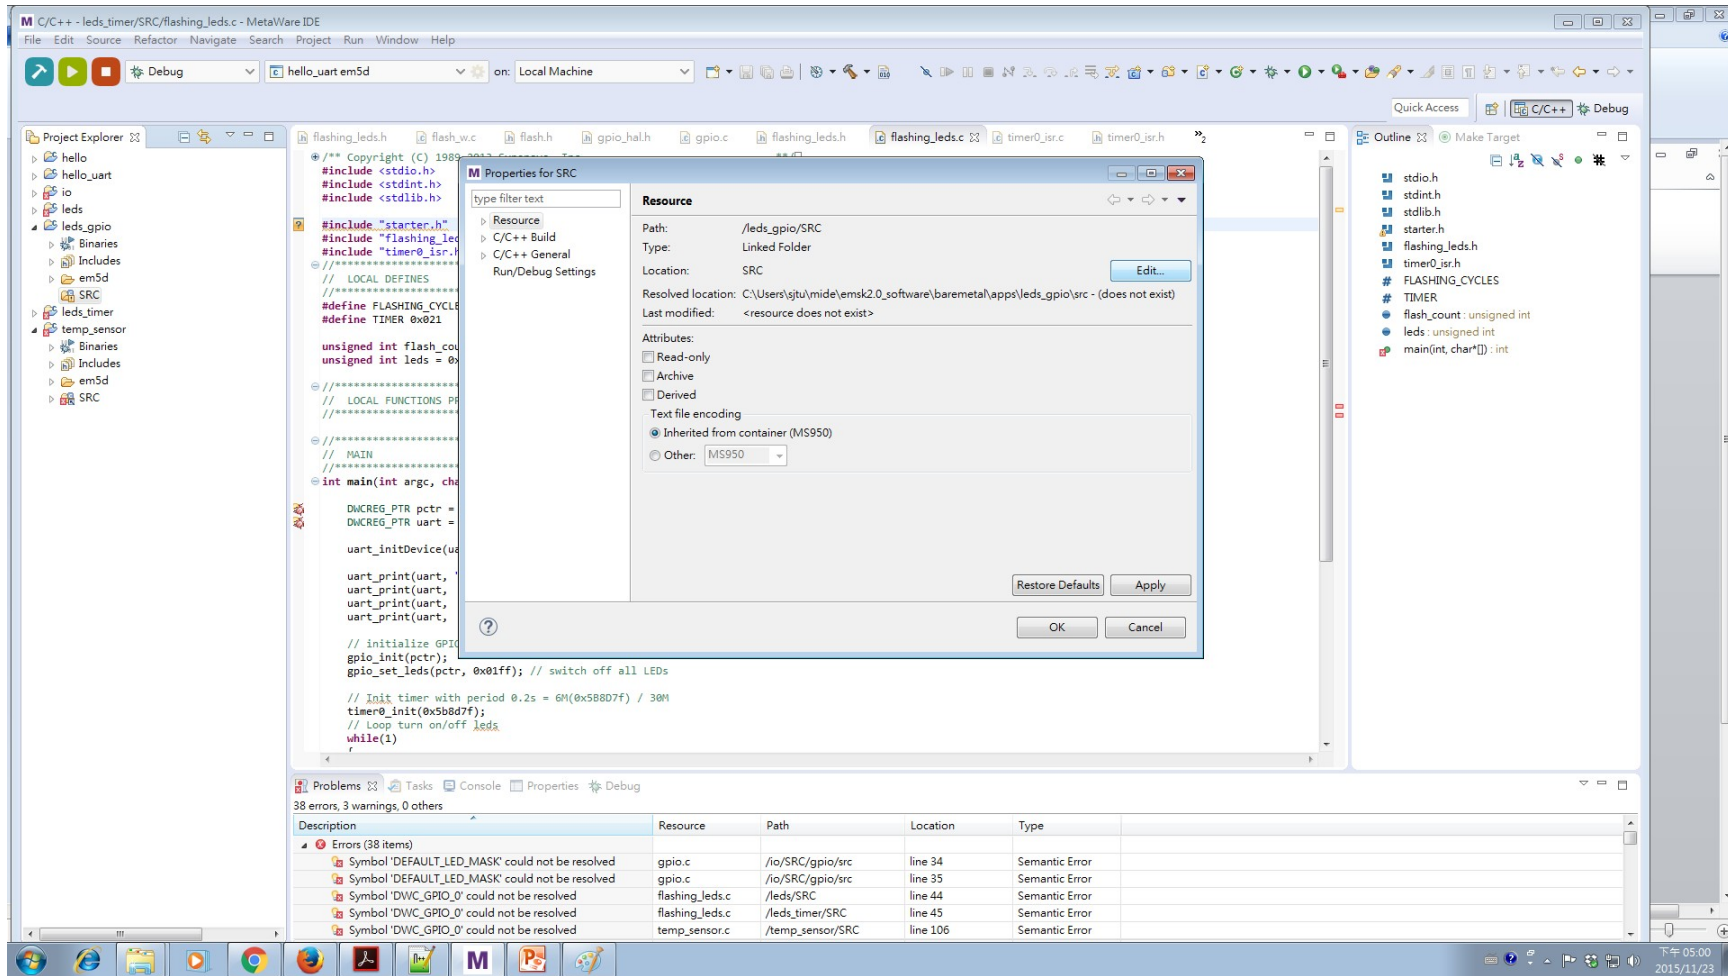

Step1:create SRC 資料夾

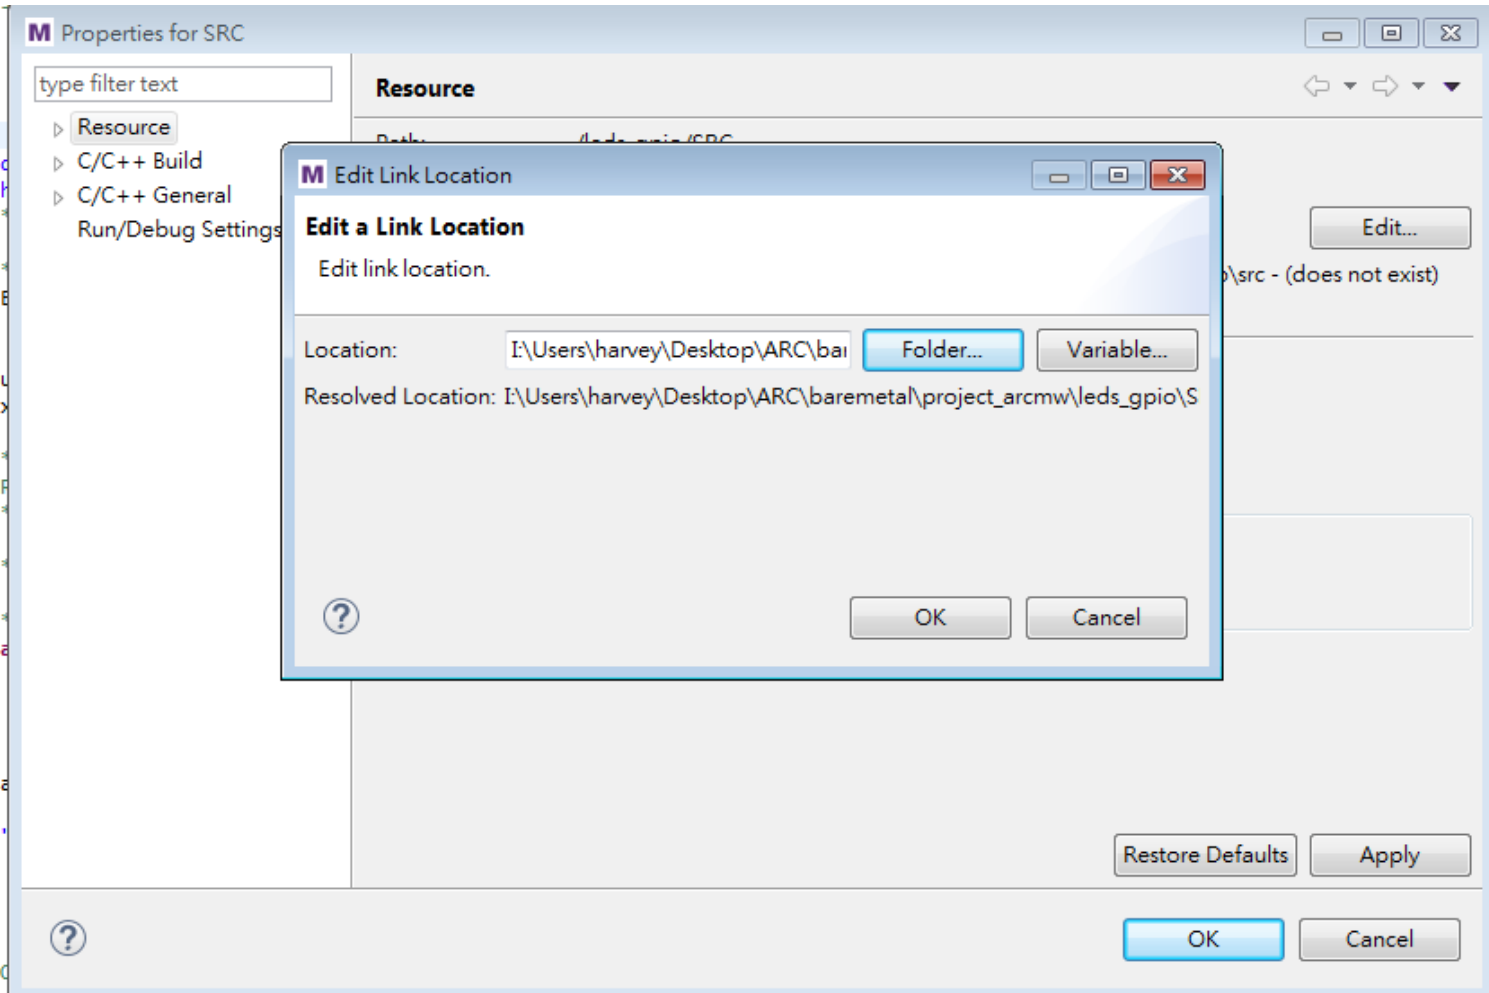

STEP2:點選SRC右鍵->PROPERTIES

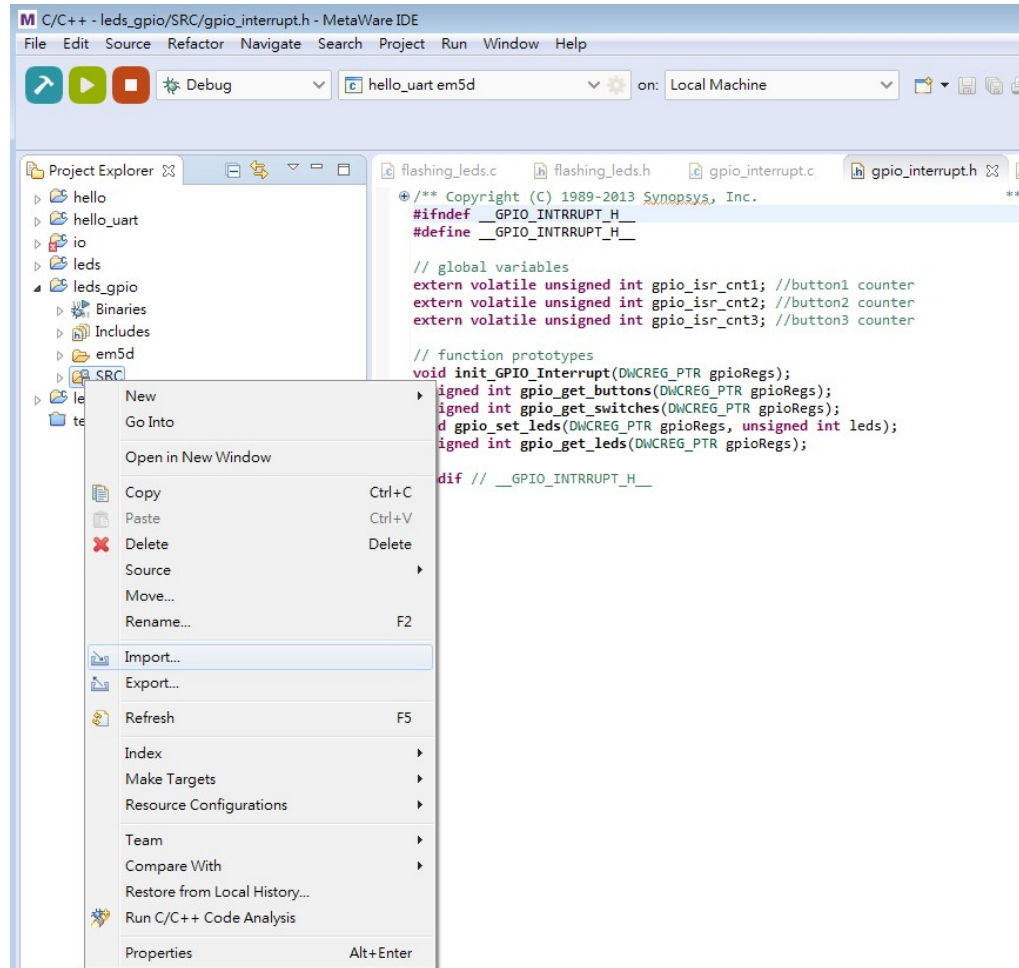

Step3: 按下edit

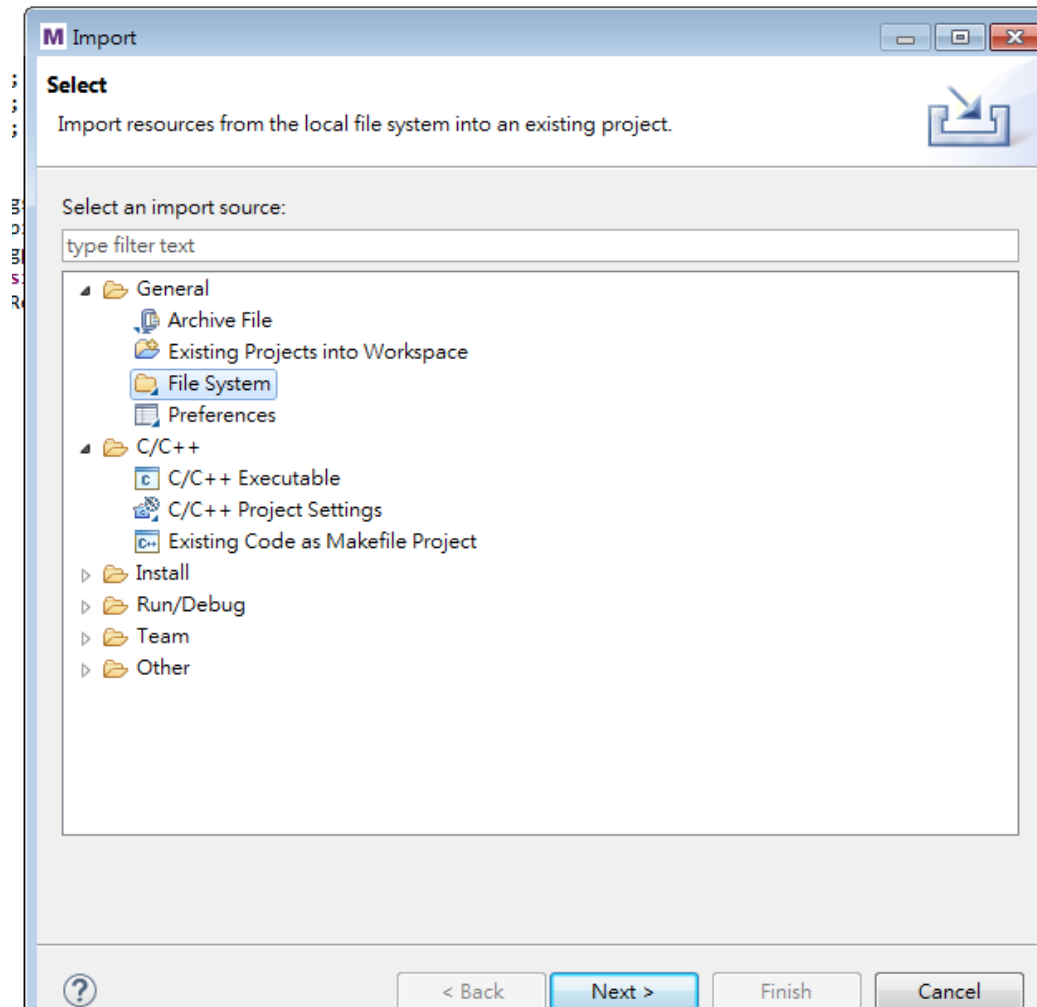

Step4:選剛才建立的src

Step5:import file system

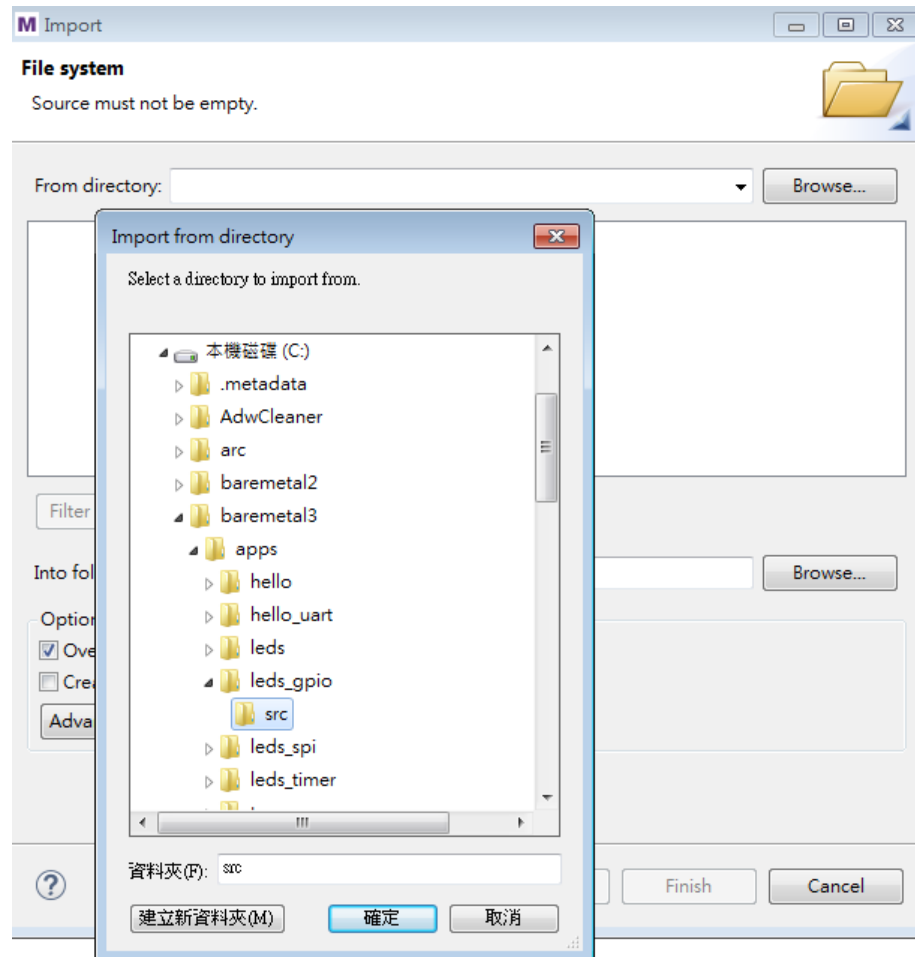

Step6:choose file system

Step7:Choose file

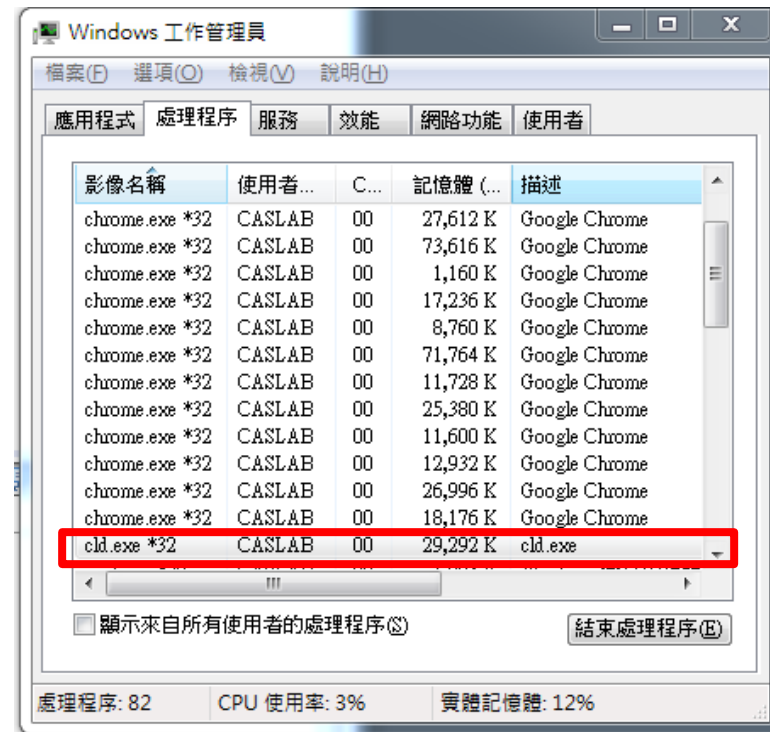

⊕ Source path:/baremetal/apps/leds_gpio/src

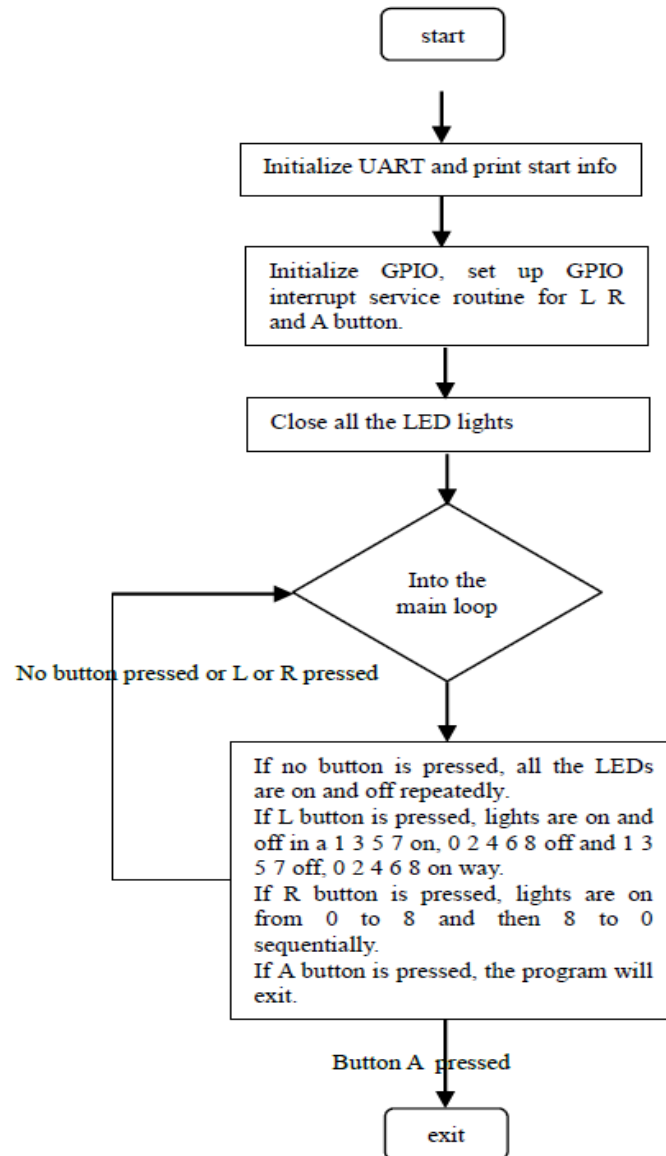

hint

- ⊕ 按下上方的執行鈕  可以快速執行程式
- ⊕ 按下方的結束鈕  可以結束目前的程式

- ⊕ 常見問題：
當無法燒入程式時，請直接
將工作管理員的”**cld.exe**”關掉

實作一 流程圖

Gpio_init

- ⊕ 初始化gpio的value(包括button、led、switches)

```
void gpio_init(DWCREG_PTR gpioRegs) {  
  
    //initilize buttons  
    gpioRegs[SWPORTA_DR] = 0;        //Data to PortA  
    gpioRegs[SWPORTA_DDR] = 0;      //PortA - input  
  
    //LED[7:0]  
    gpioRegs[SWPORTB_DR] = DEFAULT_LED_MASK;  
    gpioRegs[SWPORTB_DDR] = DEFAULT_LED_MASK; //PortB - output  
  
    //Switches  
    gpioRegs[SWPORTC_DR] = 0;        //Data to PortC  
    gpioRegs[SWPORTC_DDR] = 0;      //PortC - input  
}
```

init_GPIO_Interrupt

- ⊕ 註冊gpio的interrupt,讓按下button時會觸發gpio ISR

```
⊖ /*****  
init_GPIO_Interrupt - Initialize GPIO controller and setup GPIO ISR  
*****/  
⊖ void init_GPIO_Interrupt(DWCREG_PTR gpioRegs) {  
    _clri();                // Turn off interrupts  
  
    gpioRegs[DEBOUNCE]      = 0x00;    // Debounce disable for buttons  
    gpioRegs[INTTYPE_LEVEL] = 0x07;    // edge sensitive interrupt for buttons  
    gpioRegs[INT_POLARITY]  = 0x07;    // interrupt polarity for buttons  
    gpioRegs[PORTA_EOI]     = 0xFFFF; // clear any pending interrupts  
    gpioRegs[INTEN]         = 0x07;    // interrupt enable for buttons  
  
    // save GPIO base address for access to GPIO registers from ISR  
    gpioBaseAddress = gpioRegs;  
  
    gpio_isr_cnt1 = gpio_isr_cnt2 = gpio_isr_cnt3 = 0;  
  
    // initialize interrupt vector  
    target_setvect( GPIO_INT_VECT, Gpio_ISR);  
  
    _seti(0x10);          // Enable interrupt for priority 0  
}
```

gpio_set_leds

⊕ 設定GPIO LED腳位

Bit 8

Bit 7

Bit 0

```
// switch off all LEDs
gpio_set_leds(pctr, 0x01ff);
```

gpioRegs[SWPORTB_DR]控制每個LED燈亮暗
1 是暗 0是亮

```
void gpio_set_leds(DWCREG_PTR gpioRegs, unsigned int leds) {
    gpioRegs[SWPORTB_DR] = leds;
}
```

Exercise1: Implement the interrupt service routine

```

[ ] /*****
Gpio_ISR  -GPIO interrupt service routine; It increments gpio_isr_cnt* counter
          if corresponding button pushed.
*****/
target_interrupt void Gpio_ISR ()
[ ] {
    //read status
    unsigned int reg;
    reg = gpioBaseAddress[INTSTATUS];

    //clear interrupts
    gpioBaseAddress[PORTA_EOI] = reg;
    ///###Insert code here###
}

```

hint

1. gpioBaseAddress[INTSTATUS]為記錄gpio interrupt的狀態

- 按下L鈕 gpioBaseAddress[INTSTATUS]的BIT0為1
- 按下R鈕 gpioBaseAddress[INTSTATUS]的BIT1為1
- 按下A鈕 gpioBaseAddress[INTSTATUS]的BIT2為1

⊕ P.S. C code 不可直接用reg[0]去抓值，用bit operation去判斷

```
unsigned int reg;  
reg = gpioBaseAddress[INTSTATUS];  
  
//clear interrupts  
gpioBaseAddress[PORTA_EOI] = reg;
```

hint

2.用三個COUNTER去判斷，當按下BUTTON L 將 gpio_isr_cnt1=1;以此類推，在此ISR只需紀錄是哪一個按鈕被觸發，我們把led閃爍過程移到main function去實現

```
volatile unsigned int gpio_isr_cnt1 = 0; //button1 counter  
volatile unsigned int gpio_isr_cnt2 = 0; //button2 counter  
volatile unsigned int gpio_isr_cnt3 = 0; //button3 counter
```

Exercise2: Implement the main function

```
// switch off all LEDs
gpio_set_leds(pctr, 0x01ff);

while (1)
{
    // default behaviour
    ///###Insert code here###
    //Button "L" is pressed
    ///###Insert code here###
    //Button "R" is pressed
    ///###Insert code here###
    //Button "A" is pressed
    ///###Insert code here###
}
return 0;
```

hint

- ⊕ 用剛才的gpio_isr_cnt1、 gpio_isr_cnt2、 gpio_isr_cnt3判斷去 做相對應的動作
- ⊕ gpio_set_leds(pctr, 0x0); 控制led燈閃爍
- ⊕ delay(PULSE_DELAY); 利用delay讓led不要閃爍太快，可讓肉眼看到。

```
void delay(int ms){  
    unsigned int i=0,j=0;  
    for(i=0;i<ms;i++){  
        for(j = 0; j < CPU_CLOCK/1000; j++)  
            j++;  
        i++;  
    }  
    // busy wait  
}
```

實驗結報

⊕ 結報格式(每組一份)

- 這次需要繳交結報，請各位可以開始動手做期末Project。
- P. S. 助教可提供的模組包括溫度感測、LCD模組。

⊕ 繳交位置

- ftp : 140.116.164.225
- 帳號/密碼 : coco2016 / coco2016

⊕ DeadLine: 11/28 18:00前

⊕ TA Contact Information:

- 助教信箱 : lance91633@gmail.com
- Rm 92617
- Office hour : (Wed)09:00~12:00

Appendix1:Temp sensor project

- ⊕ 希望大家在做project前，可先做此實驗，此實驗可以熟悉如何操作溫度感測器和LCD燈
- ⊕ Reference: [Temperature_sensor_demo.pdf](#)

Appendix1:Temp sensor LCD 接法

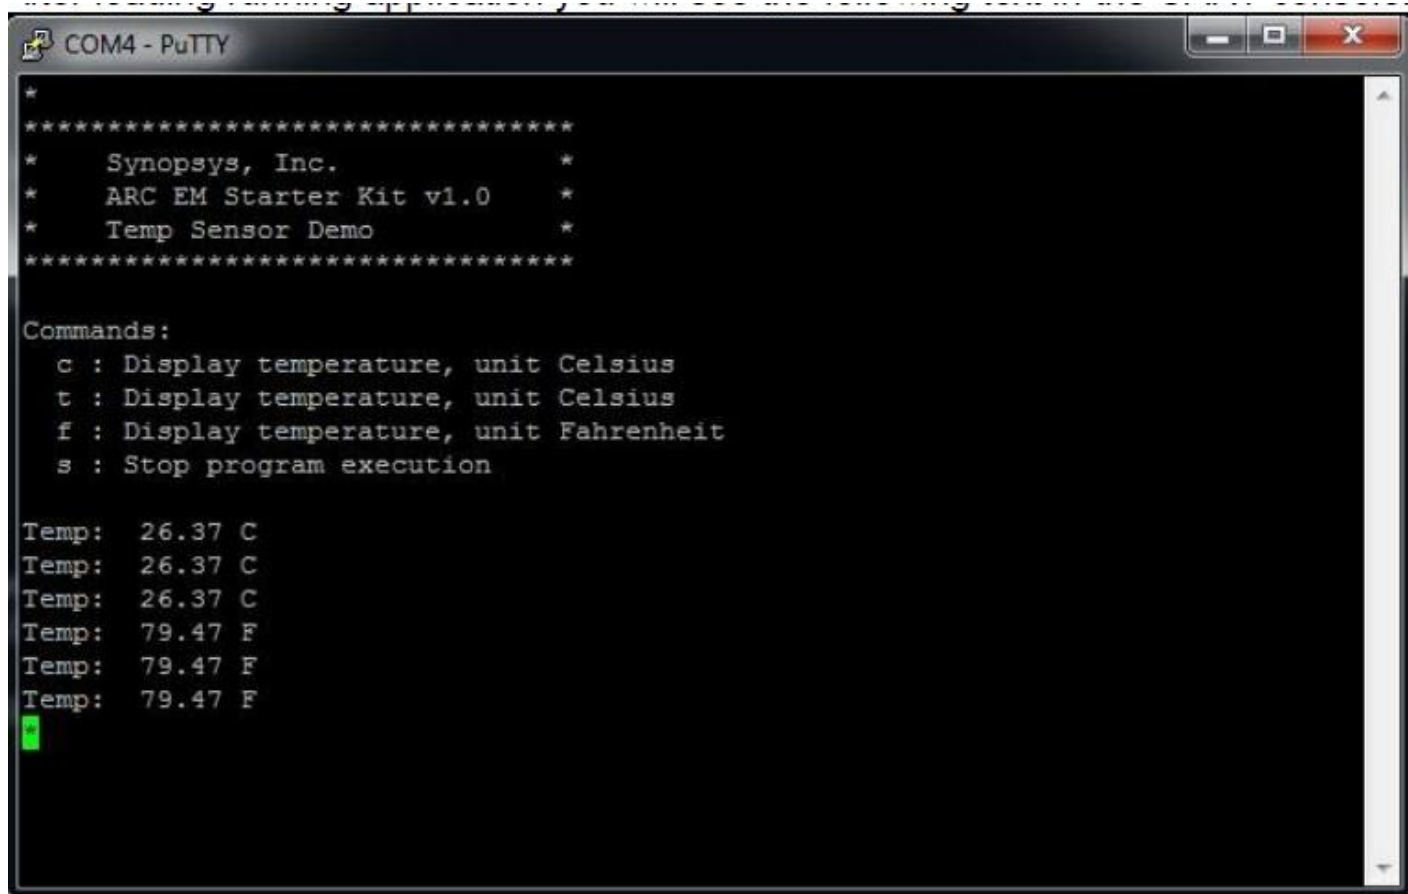

Appendix1:Temp sensor application

- ⊕ 步驟與上個實驗一模一樣 run temp_sensor project

Appendix1:Temp sensor application

- ⊕ 按下鍵盤 c、t可顯示攝氏溫度

```
COM4 - PuTTY
*
*****
*   Synopsys, Inc.           *
*   ARC EM Starter Kit v1.0 *
*   Temp Sensor Demo       *
*****

Commands:
  c : Display temperature, unit Celsius
  t : Display temperature, unit Celsius
  f : Display temperature, unit Fahrenheit
  s : Stop program execution

Temp: 26.37 C
Temp: 26.37 C
Temp: 26.37 C
Temp: 79.47 F
Temp: 79.47 F
Temp: 79.47 F
█
```

Appendix2: ARC API Introduction

```
int Read_Temp (int tmp_units, DWCREG_PTR console,  
DWCREG_PTR uart, DWCREG_PTR i2c)
```

- ⊕ Implement in the
/apps/temp_sensor/src/temp_sensor.c
- ⊕ 可看此function學習如何把溫度從I2C Temperature Sensor PmodTmp2 讀出，並且想想如何在project將它做修改以及應用

Gpio API function

- ⊕ Implement in baremetal/io/gpio/src/gpio.c
- ⊕ 裡面function 包括如何初始gpio，如何設定led燈，和 讀led燈、button、switch狀態

LCD API function

- ⊕ Implement in baremetal/io/gpio/src/lcd.c
- ⊕ 裡面function包括如何初始lcd、印字串在螢幕、清除螢幕等等基本功能

UART API function

- ⊕ Implement in baremetal/io/gpio/src/uart.c
- ⊕ 較常用的是void uart_print(DWCREG_PTR uartRegs, const char * pBuf)
- ⊕ Ex:

```
uart_print(uart, "Hello world\n\r");  
//會印hello world在putty上
```
