# Lecture 13 Derivation of State Graphs and Tables 

- Problem: a sequence detector. If 101 is detected, $\mathrm{Z}=1$. We use a clocked Mealy machine to design the network.

## Clock

$$
\begin{array}{clllllllllllllllll}
X= & 0 & 0 & 1 & 1 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 0 & 1 & 0 & 0 \\
Z= & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & (14-1) \\
\text { (time: } & 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14 & 15) &
\end{array}
$$

# Sequence Detector 

- Reset state: $\mathrm{S}_{0}$
- Stay in $S_{0}$ if 0 is received, go to $S_{1}$ if 1 is received.
(Remember the first 1 in $\mathrm{S}_{1}$ )
- 0/0 and 1/0 (Input/Output)
- In $S_{1}$, if we receive a 0 , then we go to another state $S_{2}$ to remember that 10 has been received.
- In $S_{2}$, if we receive 1, then 101 is received. We must output 1 . Then where should we go? Not reset ( $\mathrm{S}_{0}$ ). But the $\underline{1}$ in $10 \underline{1}$ may be the first 1 of the next 101. So we go back to $\mathrm{S}_{1}$

## Sequence Detector (com.)

- In $S_{1}$, if we receive a 1 , this means the restart of the 101 sequence, so we stay at $S_{1}$.
- In $S_{2}$ (we remember 10), we also need to consider what to do if we receive a 0 . This means that a 100 is received. In this case, we go back to $\mathrm{S}_{0}$ to reset.
- Each state has two exit lines.

Figure 14-4
Mealy State Graph for Sequence Detector

## Sequence Detector (cont.)

- Convert the state graph to a state table. For the arc between $S_{2}$ and $S_{1}, 1 / 1$ means that 1 output is present as soon as X becomes 1 (before the state change occurs.)

Figure 14-4
Mealy State Graph for Sequence Detector

|  | Next State |  | Present |  |
| :---: | :---: | :---: | :---: | :---: |
| Present | Output |  |  |  |
| State | $X=0$ | $X=1$ | $X=0$ | $X=1$ |
| $S_{0}$ | $S_{0}$ | $S_{1}$ | 0 | 0 |
| $S_{1}$ | $S_{2}$ | $S_{1}$ | 0 | 0 |
| $S_{2}$ | $S_{0}$ | $S_{1}$ | 0 | 1 |

# Sequence Detector (cont.) 

- We need two FFs for 3 states.

|  | $A^{+} B^{+}$ |  | $Z$ |  |
| :---: | :---: | :---: | :---: | :---: |
| $A B$ | $X=0$ | $X=1$ | $X=0$ | $X=1$ |
| 00 | 00 | 01 | 0 | 0 |
| 01 | 10 | 01 | 0 | 0 |
| 10 | 00 | 01 | 0 | 1 |

- We plot the next state table.

| ${ }_{A B}^{X}$ | 0 | 1 |
| :---: | :---: | :---: |
| 00 | 0 | 0 |
| 01 | (1) | 0 |
| 11 | X | X |
| 10 | 0 | 0 |
| $A^{+}=X^{\prime} B$ |  |  |

# Sequence Detector (cont.) 

 - Suppose we use D FFs. Then the input equation of a DFF is : $\mathrm{D}=$ $\mathrm{Q}^{+}$$-\mathrm{D}_{\mathrm{A}}=\mathrm{A}^{+}=\mathrm{X}^{\prime} \mathrm{B}$
$-D_{B}=B^{+}=X$
$-\mathrm{Z}=\mathrm{XA}$

Figure 14-5

## 101 Detection Using a Moore Network

- First reset in $S_{0}$, if 1 is received, go to $S_{1}$.
- If a 0 is received in $S_{1}$, go to $S_{2}$ to remember 10.
o

- If a 1 occurs to complete 101, we can not go back to $S_{1}$ because in $S_{1}$ the output is 0 . We need to create another state $S_{3}$.

Chap 14

## 101 Detection (cont.)

- Now we complete each state with the rest of cases that have not considered yet.

Receive 10
Come to here

Chap 14

## 101 Detection (cont.)

## - Find the state table from state

 graph. $\mathrm{Z}=\mathrm{AB}^{\prime}$.

|  |  | Present <br> AB |  | Next State |  | Present |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| State | $X=0$ | $X=1$ | Output $(Z)$ |  |  |  |
| 00 | $S_{0}$ | $S_{0}$ | $S_{1}$ | 0 |  |  |
| 01 | $S_{1}$ | $S_{2}$ | $S_{1}$ | 0 |  |  |
| 11 | $S_{2}$ | $S_{0}$ | $S_{3}$ | 0 |  |  |
| 10 | $S_{3}$ | $S_{2}$ | $S_{1}$ | 1 |  |  |

## More Complex Example

- Output $\mathrm{Z}=1$ if the input sequence ends in 010 or 1001.
- Construct some sample input and output sequences to make sure we understand the problem statement.

$$
\begin{aligned}
& \begin{array}{lllllll}
a & b & c & d & e & f
\end{array} \\
& Z=00010101100010100
\end{aligned}
$$

## More Complex (cont.)

## - 010 or 1001

- First work on the sequences that lead to a 1 output. 010 first.
- Start at a reset state $\mathrm{S}_{0}$ (no inputs received).
- In $\mathrm{S}_{2}$, the sequence ends in 01. In $\mathrm{S}_{3}$, the sequence ends in 010.
- In $S_{3}$, if we receive a 1, then we are in the sequence ending in 01.01 is remembered in $S_{2}$. So we go back to $S_{2}$.

Figure 14-7

## More Complex (cont.)

## - Now 1001

- Start at reset state $S_{0}$. If we receive 1 , we go to $S_{4}$ to remember that the first 1 in 1001 is received.
- Then 0 is received; this means a sequence ending in 10 .
» Since $S_{3}$ represents sequences ends in (0) 10 , so we go to $S_{3}$ instead of creating a new state.
- In $S_{3}, 0$ is received. We create a new state $S_{5}$ to remember 100 .

## Complex Example (cont.)

- In $S_{5}$, if we received a 1 , we complete the sequence 1001. Since 1001 ends in 01 , we go back to $S_{2}$ from $S_{5}$ if 1 is received.
- Patch up the rest:
- In $S_{1}, 1$ is already considered. 0 occurs for input (x). This is 00 . No matter how many 0 's occur, the sequence ends in 0 . So we stay at $S_{1}$. The same as in $S_{4}$.

Chap 14

## Complex Example (cont.)

## - Patch up the rest: (out-going line)

- In $S_{2}$, input 0 has considered. For input 1, then 11 occurs. 11 does not appear in 010 or 1001. So we don't need another state. Since 11 ends in 1 , so we go to $\mathrm{S}_{4}$.
- In $S_{5}$, if we get a 0 input, then the sequence ends in 000.000 is not in 010 or 1001.000 ends in 0 . So we go back to $S_{1}$.

## Moore Network Example

- Problem: input X and output Z . $\mathrm{Z}=1$ if the total number of 1 's received is odd and at least two consecutive 0 's have been received.
- Z only changes after the next active clock edge. (Moore machine example)

# $X=$<div class="inline-tabular"><table id="tabular" data-type="subtable">

 Chap 14
## Moore Network Example (cont.)

- Start with a reset state $\mathrm{S}_{0}$ with 0 output.
- Two states to remember odd number of 1 's and even number of 1's received respectively.
- Output of $S_{1}$ is 0 since two consecutive 0's have not been received.

$$
\begin{aligned}
X & = \\
& \begin{array}{lllllllll}
1 & 0 & 1 & 1 & 0 & 0 & 1 & 1 \\
a & & & & b & & \uparrow & \uparrow & \uparrow \\
\boldsymbol{a} & d & e
\end{array} \\
Z & =(0) \\
\hline & 0
\end{aligned} \begin{array}{llllllll}
0 & 0 & 0 & 0 & 1 & 0 & 1
\end{array}
$$

Figure 14-10

## Moore Network Example (cont.)

- In $S_{0}$, if we receive a 0 , then the first 0 of sequence of 00 starts. We go to $S_{2}$. ( $\mathrm{S}_{2}$ : even 1 's and 0 ).
- Another 0 takes us to $S_{3}$ (even 1's and 00).
- In $S_{3}$, if we receive 1, then 00 and odd number of 1's occurs. We go to $S_{4}$ and set output $=1$.

## FIGURE 14-11

| state | sequence received |
| :--- | :--- |
| $S_{0}$ | reset or even 1's |
| $S_{1}$ | odd 1's |
| $S_{2}$ | even 1's and ends in 0 |
| $S_{3}$ | even 1's and 00 has occurred |
| $S_{4}$ | 00 has occurred and odd i's |

## Moore Network Example (cont.)

- In $S_{4}$, if we receive 1 , then 00 and even number of 1's occurs. We go back to $S_{3}$. In the same way, we can construct $\mathrm{S}_{5}$ and the rest of the output going line in each state.

FIGURE 14-12

Get 00
first then
odd one

| state | input sequences |
| :---: | :--- |
| $S_{0}$ | reset or even 1's |
| $S_{1}$ | odd 1's |
| $S_{2}$ | even 1's and ends in 0 |
| $S_{3}$ | even 1's and 00 has occurred |
| $S_{4}$ | odd 1's and 00 has occurred |
| $S_{5}$ | odd 1's and ends in 0 |

Get odd one first then 00 .

## Guideline for Construction of State Graph

- Construct sample input and output to understand the problem.
- Determine the initial state.
- Construct partial graph according to the sequences that lead to a nonzero output.
- Check to see if an arrow should go a new state or a previously defined state.
- Check if the input sequences and output sequences match the requirement when the graph is complete.

## More example

- Problem: input X and output Z. If input forms 0101 or 1001, then $\mathrm{Z}=1$. The network resets after every four inputs. Find the Mealy state graph.

$$
\begin{array}{llll}
\mathrm{X}=\underline{0101} & 0010 & \underline{1001} & 0100 \\
\mathrm{Z}=\underline{0001} & 0000 & 0001 & 0000
\end{array}
$$

## reset reset reset

Note: If 01 or 10 followed by 01 , then $Z=1$.

## More example (cont.)

- 0101 or 1001. If 01 or 10 followed by 01 , then $\mathrm{Z}=1$.
- This partial graph shows 0101 and 1001 sequences.

## More example (cont.)

## - Wrap up the rest

- Use $S_{5}$ and $S_{6}$ to accommodate the rest of 4-bit sequences. For $S_{5}$, either 00 or 11 is received. No output of 1 is possible until the network is reset.

FIGURE 14-14 Complete State Graph for Example 1

| state | sequence received |
| :--- | :--- |
| $S_{0}$ | reset |
| $S_{1}$ | 0 |
| $S_{2}$ | 1 |
| $S_{3}$ | 01 or 10 |
| $S_{4}$ | 010 or 100 |
| $S_{5}$ | two inputs received, no 1 |
| output is possible |  |
| $S_{6}$ | three inputs received, no 1 <br> output is possible |

## Mealy Machine Example

- A sequential network that generates the output sequence $0101 \underline{110} \underline{110}$ $110 \ldots$.
- Homework: Realize the network.

EXAMPLE 2 Find the Mealy state graph for a sequential network which generates the output sequence $0101 \underline{110} \underline{110} \underline{110} \ldots$

Solution:

(A blank space above the slash indicates that the network has no input other than the clock.)

## Moore Machine

## Example

## - Multiple inputs

## - Assign previous inputs to states.

EXAMPLE 3 A sequential network has two inputs $\left(X_{1}, X_{2}\right)$ and one output $(Z)$. The output remains a constant value unless one of the following input sequences occurs:
(a) The input sequence $X_{1} X_{2}=01,11^{2}$ causes the output to become 0 .
(b) The input sequence $X_{1} X_{2}=10,11$ causes the output to become 1 .
(c) The input sequence $X_{1} X_{2}=10,01$ causes the output to change value. Derive a Moore state graph for the network.

Solution: The only sequences of input pairs which affect the output are of length two. Therefore, the previous and present inputs will determine the output, and the network must "remember" only the previous input pair. At first it appears that three states are required, corresponding to the last input received being $X_{1} X_{2}=01,10$ and ( 00 or 11 ). Note that it is unnecessary to use a separate state for 00 and 11 since neither input starts a sequence which leads to an output change. However, for each of these states the output could be either 0 or 1 , so we will initially define six states as follows:

| Previous <br> Input $\left(X_{1} X_{2}\right)$ | Output <br> $(Z)$ | State <br> Designation |
| :---: | :---: | :---: |
| 00 or 11 | 0 | $S_{0}$ |
| 00 or 11 | 1 | $S_{1}$ |
| 01 | 0 | $S_{2}$ |
| 01 | 1 | $S_{3}$ |
| 10 | 0 | $S_{4}$ |
| 10 | 1 | $S_{5}$ |

## Moore Machine Example (cont.)

## - Derive state table

- For $S_{4}$, if 00 is received, the input sequence is 10,00 , the output does not change. We go to $S_{0}$ to remember that the last input received was 00 .
- If 01 is received at $S_{4}$, then 10,01 is received. Then $Z(=0)$ is changed to 1 . And we go to $\mathrm{S}_{3}$ to remember that last input was 01.

| Previous <br> Input $\left(X_{1} X_{2}\right)$ | Output <br> $(Z)$ | State <br> Designation |
| :---: | :---: | :---: |
| OO or 11 | 0 | $S_{0}$ |
| OO or 11 | 1 | $S_{1}$ |
| O1 | 0 | $S_{2}$ |
| O1 | 1 | $S_{3}$ |
| 10 | 0 | $S_{4}$ |
| 10 | 1 | $S_{5}$ |

| Present <br> State | $Z$ | $X_{1} X_{2}=00$ | 01 | 11 | 10 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $S_{\mathrm{o}}$ | 0 | $S_{\mathrm{o}}$ | $S_{2}$ | $S_{\mathrm{o}}$ | $S_{4}$ |
| $S_{1}$ | 1 | $S_{1}$ | $S_{3}$ | $S_{1}$ | $S_{5}$ |
| $S_{2}$ | 0 | $S_{\mathrm{o}}$ | $S_{2}$ | $S_{0}$ | $S_{4}$ |
| $S_{3}$ | 1 | $S_{1}$ | $S_{3}$ | $S_{0}$ | $S_{5}$ |
| $S_{4}$ | 0 | $S_{0}$ | $S_{3}$ | $S_{1}$ | $S_{4}$ |
| $S_{5}$ | 1 | $S_{1}$ | $S_{2}$ | $S_{1}$ | $S_{5}$ |

## Serial Data Code Conversion

- General block diagram
- Data and clock transmitted separately.
- (Clock + Data) transmitted as a signal.
- Need a digital phase-locked loop circuit to regenerate the clock signal at the receiver end.

(a)

## Coding Schemes

- NRZ (non-return-to-zero):
- Each bit is transmitted for one bit time without any change.
- NRZI (non-return-to-zero Inverted-on-1s)
- A 0 is encoded by no change in the transmitted value, and a 1 is encoded by inverting the previous transmitted value. ( 0 no change of previous value, 1 inverting previous value)

## Coding Schemes (cont.)

- RZ (return-to-zero):
- A 0 is transmitted as NRZ, but a 1 is transmitted as a 1 for the first half of the bit time and signal returns to 0 for the second half.
- Manchester
- A 0 is encoded as a 0 -to- 1 transition in the middle of the bit time and a 1 is encoded as a 1-to-0 transition.
» Ethernet (10/100 Mbps)

# Code conversion Network <br> (Mealy machine) 

- Convert a NRZ-coded bit stream to a Manchester-coded bit stream.
- Clock2 is twice the frequency of the basic block.
- After each conversion, reset to $\mathrm{S}_{0}$.

(b) Timing chart

Chap 14

## Code conversion Network

## - State graph and table

- In $\mathrm{S}_{1}, \mathrm{X}=1$ does not occurs because X
$=00$ seen from CLOCK2.
- In $S_{2}, X=0$, does not occurs because $X$
$=11$. Treat them as don't care.
» Note that glitch occurs if X is delayed w.r.t. basic clock.

(b) Timing chart

(c) State graph

| Present Next State  Output $(Z)$  <br> State     | $X=0$ | $X=1$ | $X=0$ | $X=1$ |
| :---: | :---: | :---: | :---: | :---: |
| $S_{0}$ | $S_{1}$ | $S_{2}$ | 0 | 1 |
| $S_{1}$ | $S_{0}$ | - | 1 | - |
| $S_{2}$ | - | $S_{0}$ | - | 0 |

# Code conversion Network <br> (Moore Machine) 

## - Moore State graph and table

- Output is delayed by one clock. (why?)
- 1 input cannot occur in $S_{1}$.
- 0 input can not occur in $S_{3}$.
- Work on 00 then work on 11 . Then patch up the rest.

(a) Timing chart

This can not be the first state for the first $N R Z=1$. So either for the first 1 or 0 , the output is delayed for one clock.

(b) State graph

| Present <br> State | Next State |  | Present |
| :---: | :---: | :---: | :---: |
| $S_{0}$ | $S_{1}$ | $S_{3}$ | 0 |
| $S_{1}$ | $S_{2}$ | - | 0 |
| $S_{2}$ | $S_{1}$ | $S_{3}$ | 1 |
| $S_{3}$ | - | $S_{0}$ | 1 |

(c) State table

## State graph with variable

## names

- In (a), all F's (forward) for input sequence, output = $Z_{1} Z_{2} Z_{3} Z_{1} Z_{2} Z_{3} \ldots$ and all R's for reverse output. (a) is not properly specified.
- In state S 0 what if $\mathrm{F}=1$ and $\mathrm{R}=1$ ? We must resolve this by assuming F has a high priority, for instance.
- In (b), R is changed to F'R. S0 to S 2 if $\mathrm{F}=0$ and R $=1$.

(a)

(b)

Assuming input F takes priority over input R

| TABLE 14-8 State Table for | PS | $F R=00 \quad 01$ |  |  |  | Output $Z_{1} Z_{2} Z_{3}$ |

Chap 14 The same

## Completely specified state

## graph

- OR all the labels emanating from a state, the result is 1. (output arcs of a state)
- In $\mathrm{S}_{0}, \mathrm{~F}+\mathrm{F}^{\prime} \mathrm{R}+\mathrm{F}^{\prime} \mathrm{R}^{\prime}=1$
- For every input combination, at least one next state is defined. One of the labels must be true.
- AND any pair of the labels on arcs emanating from a state, the result is 0 .
- In $\mathrm{S}_{0}$, F. $\mathrm{F}^{\prime} \mathrm{R}=0$, F.F'R' $=0$, $\mathrm{F}^{\prime}$ R.F'R' $=0$
- For every input combination, no more than one next state is defined. (no more than two 1's is defined, i.e., so will not go to two states.)
- If both are true, then exactly one next state is defined.

# Incompletely Specified Graph 

- If we know certain input combinations cannot occur, then an incompletely specified graph is acceptable!
- For example, if $\mathrm{F}=1, \mathrm{R}$ must be 0 and if $\mathrm{R}=1, \mathrm{~F}$ must be 0 .
